## **Sonifex talkback**

The new CM-TB8 Talkback Control Unit from Sonifex provides eight channels of four-wire communication, housed in 1RU. It offers a headset socket on 5-pin XLR and mic/phones on XLR/stereo TRS jack, with the current selection indicated on the front panel. The gain for each input type can be individually set between +6dB and +68dB, allowing for a wide range of microphone types, with +48V phantom power also available. Small talk-level adjustments can be made quickly using the front panel rotary control with a maximum adjustment range of  $\pm 12$ dB.

An optional add-in card allows up to two channels to be connected to a telephone or GSM network, while a total of six configuration templates allow settings to be stored and recalled at a later date. **8.E61**
